

Name:Edwin Salisbury

Date: Monday May 3rd, 2021

Location: New Orleans, La

Last week I had a sore throat and a cough. My mom took me to get a covid test.

I tested positive so that meant I had to do quarantine for two whole solid weeks or 14 days or 336 hours or 20,160 minutes. My mom had to do an interview with the New Orleans Health Department in order to help with contact tracing for everyone's safety. I have absolutely no idea how the heck I managed to get Sars cov2 or COVID-19. I always wore a mask, I always tried to be socially distant. It is possible for someone with COVID-19 to infect you even if you are wearing a mask if the person infected is not wearing a mask. This is because if the infected person is not wearing a mask the droplets that contain the virus can become smaller by evaporation and ride the air currents. They can become small enough that they can slip through the weavings of a mask. This is why if you have COVID-19 you should always wear a mask in order to infect people. The mask traps the droplets containing the virus before they can evaporate. I really doubted this is how I got infected though. My symptoms only lasted 3 days before they disappeared. Most people who get serious health complications are usually old or obese or have some other health complication. My mom and dad finished her vaccines so they are no longer able to get infected and transmit the virus.

My theme of this year was Novelty and I say that I pretty much accomplished that. I tried new things like hydrogen generation and 3d printing gifts for people.

I do themes because they are more flexible and less likely to fail.
